

I'm not robot!

Home Geography & Travel Physical Geography of Land Mountains & Volcanoes Bee Breeders is wrapping up its first country-based architecture competition series, with its third prospective site located in northern Iceland. This international call for ideas tasked participants with proposing a design solution for a Volcano Museum near Hverfjall volcano in Iceland's Dimmuborgir region. The famed Hverfjall Volcano has a large, circular crater measuring roughly 140 meters deep and 1,000 meters wide, estimated to have been created 2500 years ago by a volcanic explosion. The crater's dimensions make it one of the largest on land in the world. Today, two walking paths permit visitor and trekker access to the rim of the crater - one from the northwest, and one from the south. For the Iceland Volcano Museum competition, Bee Breeders sought submissions for a multi-purpose exhibition hall with café and informational space, as a landing point for visitors to the Hverfjall. The intent for this building is to be flexible, the capacity to host 3 to 4 temporary installations simultaneously. The program brief also called for an office complex, with 15 to 20 workspaces, meeting rooms, private offices, and open-plan office spaces for employees. The proposed site, located between Myvatn Lake and the Hverfjall, is stark, yet stunning. A goal for this potential new landmark is to create a place for visitors which enhances the experience of this beautiful natural site. The submissions took full advantage of this environment not only to locate an exhibition space, but also to design a building integrated with its surroundings. Many sought to re-create the volcano in form, with large circular or conical volumes and crater-like inner courts. Others used volcanic rock or local stone to clad or serve as the structure for the building. The jury, above all, sought clear and sensitive design ideas for buildings that materially and visually connected with the landscape, without artificially attempting to mimic it. Bee Breeders applauds the winning and shortlisted entries below, and to all of the participants that offered design ideas for this Volcano Museum. We look forward to hosting other future country-based competition series, which focus Bee Breeders' global audience of architects on a specific and unique region, through a selection of local sites that might benefit from new buildings, installations, or design ideas. Ten years have passed since the 2010 eruption in Eyjafjallajökull. On 14 April 2010, the Icelandic volcano Eyjafjallajökull erupted explosively, hurling volcanic ash several kilometers into the atmosphere. These volcanic events, caused air traffic to close down across Western and Northern Europe from 15th to 20th of April 2010, creating the highest level of air travel disruption since the Second World War. About 20 countries closed their airspace to commercial jet traffic and it affected approximately 10 million travelers. Pilot 6.1 Ash generation and distribution from the April-May 2010 eruption of Eyjafjallajökull, Iceland Magnús T. Gudmundsson1, Thorvaldur Thordarson2, Armann Höskuldsson1, Guðrún Larsen1, Halldór Björnsson3, Fred J. Prata4, Björn Oddsson1, Eyjólfur Magnússon1, Þorðis Högnadóttir1, Guðrún Nina Petersen3, Chris L. Hayward2, John A. Stevenson2 & Ingibjörg Jónsdóttir1 Scientific Reports 2, Article number: 572 (2012) Cite this article 31k Accesses 239 Citations 86 Altmetric Metrics Atmospheric scienceGeologyVolcanology The 39-day long eruption at the summit of Eyjafjallajökull volcano in April–May 2010 was of modest size but ash was widely dispersed. By combining data from ground surveys and remote sensing we show that the erupted material was $4.8 \pm 1.2 \cdot 10^{11}$ kg (benmoreite and trachyte, dense rock equivalent volume 0.18 ± 0.05 km³). About 20% was lava and water-transported tephra, 80% was airborne tephra (bulk volume 0.27 km³) transported by 3–10 km high plumes. The airborne tephra was mostly fine ash (diameter
